CASE STUDY · SAMPLE PROJECT, SIMULATED DATA

D2C Profit Cockpit

A fictional skincare brand sold on Shopify, Amazon and a beauty marketplace, and ran Meta ads. Every source reported revenue differently, so nobody knew which products made money.

5 → 1
messy exports merged into one profit model

18
data problems found, fixed and logged

41/41
product name spellings matched to the right SKU

#1 → #2
bestseller's rank once true profit was counted

THE CHALLENGE AND THE METHOD

Messy files in. One trusted model out.

WHAT WAS WRONG

- Marketplace report had no SKU column, only 41 spellings of 20 product names
- Three different date formats; Amazon dates as DD/MM text
- Test and cancelled orders mixed with real orders
- Returns in a separate sheet; storage fees mixed with orders
- Amounts and commission stored as text; duplicate rows
- One product with no cost price

WHAT I DID

- Python cleaning pipeline with every fix logged
- Pattern rules and fuzzy matching to map every product to its SKU
- Agreed business rules for fees, couriers, returns and resaleable stock
- Shared ad spend allocated by each product's website revenue (reconciles to the rupee)
- Star schema: fact_sales, fact_ads, dim_product, dim_date
- Dashboard in Power BI with DAX; web version for sharing

HOW IT WAS BUILT

FINDINGS AND RECOMMENDATIONS

Real findings, not just charts.

FINDING 01 — all channels · 6 months

The bestseller is not the best earner.

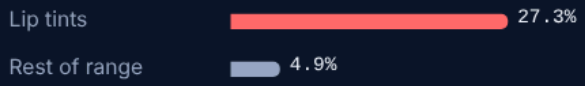

The serum brings 18.6% of all revenue, but the sunscreen earns more profit on 55% of the sales. The serum averages a 22% website discount, and its Meta spend equals 65% of its Shopify revenue.

RECOMMENDATION

Move part of the serum's ad budget to the sunscreen and cap serum discount codes at 15%.

FINDING 02 — BeautyMart

Lip tints come back 1 in 4 times.

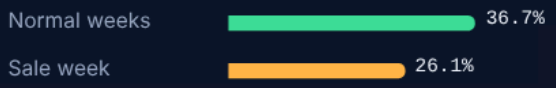

Returned lipstick can't be resold. Three lip tints with ₹6.9L of revenue keep only a 4.5% margin after ads, while the rest of the range averages over 30%.

RECOMMENDATION

Add a shade guide and real-skin swatches to the listing, or sell lip tints only where returns are low.

FINDING 03 — June sale week

The marketplace sale bought volume, not profit.

Margin before ads fell by 10 points during sale week, because discounts reached 35% on top of the 25% marketplace commission.

RECOMMENDATION

Join the next sale with a curated set of high-margin products, not the full range.

Every number in the dashboard traces back to the client's own files. Available in Power BI, Looker Studio or Google Sheets.
